

SEARCH & AI VISIBILITY

Be the answer — wherever the question gets asked.

Your next customer might type into Google, or they might ask ChatGPT who to call. Both are forming an opinion about your business before your website ever loads. This program tunes your entire presence — site, search, and the AI engines that now advise your customers — and then grows it, month over month, with reporting you can read in one page.

01

How people find you now.

For twenty years, being found meant ranking in a list of blue links. That world still matters — but it's no longer the whole instrument. Today your visibility plays on three surfaces at once:

Classic search

Google's results and the local map pack — still where the calls come from, especially when someone needs you today.

AI answers

ChatGPT, Gemini, Perplexity, and Google's own AI Overviews now answer "who should I call?" directly — naming three to five businesses before a single website is visited.

The machine-readable layer

Structured data, consistent business information, and review signals — the substrate both search engines and AI draw from when they decide whom to recommend.

What actually produces calls.

Most agencies blur this. We'd rather show you our sheet music. In order of impact for a local service business:

01 Google Business Profile & the map pack

Where the phone calls live. Categories, services, photos, posts — kept active and accurate.

02 Review velocity

Count, recency, and owner responses. Also the single biggest input AI engines use when they recommend a local company.

03 Service & area pages

Pages matched to what people in your market actually need, where they need it — the searcher is already holding the problem.

04 Site conversion mechanics

Fast pages, mobile-first, click-to-call where the thumb expects it. Visibility is wasted if the site doesn't convert.

05 Citations & entity consistency

Your name, address, and details agreeing everywhere — the quiet foundation Google and AI both check.

06 Content & schema architecture

Genuine answers to real customer questions, structured so engines can quote you cleanly.

07 AI-answer visibility

The growing share of decisions made before Google even loads — largely a product of doing the six things above well, and worth measuring on its own.

The program.

Two movements: get the foundation right once, then build on it every month.

Phase one — the foundation sweep

\$3,500 one-time

A fixed-price engagement. Typically 3–4 weeks. Yours to keep even if we stop here.

- **Technical & performance tune-up** — code-level cleanup, speed, mobile, indexability; the full diagnostic audit with before/after measurement
- **Schema architecture** — a complete structured-data graph of your business: who you are, what you do, where you serve, wired so engines and AI read it without guessing
- **Content machine-readability** — restructuring key pages so the answers in them can be found, extracted, and quoted
- **Business profile & citations reset** — Google Business Profile rebuilt properly; your business data made consistent across the web
- **Baseline visibility report** — where you rank, where you appear in AI answers today, and who's getting recommended instead of you

Phase two — monthly growth

from \$950/month

Scoped precisely after the sweep's baseline — so you pay for what your market requires, nothing more.

- **Reputation engine** — a working review system: requests after every job, owner responses, listings kept consistent
- **Service & area page build-out** — steadily composing the pages that match real demand in your market
- **Content that answers** — drafted with AI for range, edited by humans for truth, structured for both Google and the assistants
- **Authority building** — earning the local mentions and links that engines treat as references
- **The one-page monthly report** — calls and quote requests first, rankings and AI visibility behind them. You always know what was done and what moved.

04

Measured where the market is going.

SIGNAL · BY NEW BLOOD

We track what the AI engines say about you.

Every month, our Signal monitoring asks the major AI assistants the questions your customers ask — "best *your trade* in *your town*," in dozens of variations — and records who gets named. Your report shows whether you're being recommended, who is when you aren't, and how that's trending as the work compounds. To our knowledge, no one else quoting you this month can show you that page.

05

The math, plainly.

We won't promise rankings — no honest practitioner can. We'd rather anchor this in arithmetic you can check against your own books:

1–2 jobs

For most service businesses, one to two booked jobs cover an entire month of the program

3–6 months

The honest window for organic results to take hold — groundwork first, compounding after

1 page

The monthly report: leads first, evidence behind it. No vanity metrics, no mystery

06

Terms that respect you.

Initial build	90 days — the minimum honest runway for organic work to register. We set explicit targets against the sweep's baseline.
Day-90 review	We sit down with the trend lines. If the work isn't moving them, we'll say so first — before you have to ask.
After that	Month to month. No annual contract, no lock-in. We'd rather keep you with results than with paperwork.
Transparency	Every month's work is itemized in your report. You own everything we build — content, pages, profiles, data.
